

Maison Simon App Requirements Document

Luxury Styling, Powered by Intelligence.

1. Overview

Maison Simon is a luxury AI-powered fashion styling app designed to help users discover, curate, and shop personalized looks inspired by premium fashion, celebrity style, and current trends. The platform blends AI styling, closet intelligence, trend discovery, and premium shopping into one elegant user experience.

2. Product Vision

Build a premium fashion-tech platform that feels like a personal luxury stylist in the user's pocket. The app should deliver personalized outfit recommendations, trend-based discovery, celebrity-inspired style guidance, closet-aware suggestions, and seamless pathways to shop curated looks.

3. Goals

- Deliver personalized outfit recommendations using AI.
- Present a premium, luxury-brand user experience.
- Help users discover looks based on occasion, vibe, body preferences, and budget.
- Blend fashion inspiration with direct product discovery and shopping.
- Support both women's and men's styling.
- Incorporate trend intelligence, including TikTok-style and viral fashion trends.
- Enable long-term engagement through saved looks, closet intelligence, and profile personalization.

4. Target Users

Primary Users

- Fashion-conscious consumers seeking premium outfit recommendations.
- Users who want celebrity-inspired or trend-inspired looks.
- Users who want styling help for specific occasions.
- Shoppers interested in both luxury and accessible fashion options.

Secondary Users

- Users building capsule wardrobes.
- Users who want to digitize and use their own closet for styling.
- Users who want premium AI-assisted styling instead of hiring a personal stylist.

5. Core User Problems

- Users do not know what to wear for specific occasions.
- Users struggle to combine trends with personal style.
- Users want curated shopping instead of browsing endless products.

- Users want outfit inspiration that matches their body, size, and vibe.
- Users want help using items they already own.
- Users want fashion discovery that feels premium, modern, and personalized.

6. Functional Requirements

6.1 User Onboarding

- Users can create an account or continue as guest.
- Users can select gender/style profile preferences.
- Users can enter size preferences.
- Users can set favorite style categories.
- Users can define budget range.
- Users can choose preferred retailers and luxury level.
- Users can optionally choose favorite celebrities/style inspirations.

6.2 AI Style Generator

- Users can enter a free-text style prompt.
- Users can select occasion.
- Users can select season.
- Users can select budget.
- Users can select size.
- Users can select gender or unisex preference.
- Users can request multiple outfit recommendations at once.
- The system should generate curated outfit cards with:
 - look name
 - style description
 - occasion tag
 - estimated total price
 - itemized outfit pieces
 - shopping links or product recommendations
- Users can regenerate or refine recommendations.

6.3 Celebrity-Inspired Styling

- Users can browse celebrity inspiration profiles.
- Users can tap a celebrity to generate looks inspired by that style.
- The system should support celebrity-inspired styling while adapting recommendations to the user's preferences.
- Users can save favorite celebrity profiles.

6.4 Trend Discovery

- The app should include a TikTok trends or trending looks section.

- Users can browse trend categories such as:
- luxury streetwear
- clean minimal
- old money
- techwear
- Y2K
- vacation luxe
- Trends should be updateable by admins or API sources.
- Users can tap a trend to generate trend-aligned looks.

6.5 Look Details

- Users can open a full look detail page.
- A look detail page should show:
- hero look image
- item breakdown
- individual prices
- total outfit cost
- related styles
- option to save look
- option to shop the look
- Users can swap items inside the look.

6.6 Product Discovery and Shopping

- Users can browse curated fashion products.
- Products should support filtering by:
- category
- price
- style
- brand
- retailer
- trend
- Products can be marked as internal, affiliate, or partner items.
- Users can click through to retailer or checkout flow depending on business model.
- Users can add items to favorites or bag.

6.7 Closet Intelligence

- Users can upload or manually add clothes from their own closet.
- Users can categorize closet items.
- The app can recommend outfits using owned closet items plus suggested missing pieces.

- Users can browse closet by category.
- Users can request outfit ideas from closet contents.

6.8 Saved Looks and Favorites

- Users can save looks.
- Users can save products.
- Users can save celebrities, trends, and style boards.
- Users can revisit saved content from profile or saved section.

6.9 User Profile

- Users can update profile information.
- Users can update style preferences.
- Users can update size and fit preferences.
- Users can update budget preferences.
- Users can manage saved looks and closet content.

6.10 Search

- Users can search for products, trends, celebrities, and looks.
- Search should support keywords and style concepts.

6.11 Admin / Content Management

- Admin can manage trend categories.
- Admin can manage featured celebrities.
- Admin can manage hero banners and editorial content.
- Admin can manage featured looks and products.
- Admin can update retailer/affiliate relationships.

7. Non-Functional Requirements

7.1 Design / UX

- The interface must feel premium, luxury, modern, and elegant.
- The app should use a polished dark luxury aesthetic with gold or muted premium accents.
- The experience must work well on mobile first, but also support responsive web.
- Navigation must be intuitive and visually clean.

7.2 Performance

- Key pages should load quickly.
- Images should be optimized for mobile and web.
- AI-generated results should return within acceptable response times.

7.3 Scalability

- Architecture should support growth in users, products, trends, and content.
- The app should be modular so features can expand over time.

7.4 Reliability

- App should gracefully handle missing product images or unavailable data.
- API failures should return user-friendly messages.
- Fallback states should be implemented for all core content areas.

7.5 Security

- User authentication and account data must be securely handled.
- Sensitive keys must be stored in environment variables.
- Admin access must be role-protected.

8. Suggested Screens

- Splash / welcome screen
- Onboarding flow
- Home / discover dashboard
- AI style generator screen
- Celebrity inspiration screen
- Trending looks / TikTok trends screen
- Look detail screen
- Product catalog / shop screen
- Closet screen
- Saved looks / favorites screen
- User profile screen
- Settings screen

9. Data Requirements

User Data

- name
- email / auth id
- preferences
- gender/style profile
- size profile
- budget profile
- saved items
- closet items

Content Data

- celebrity profiles
- trend categories
- style prompts
- outfit recommendations
- product catalog
- retailer information
- affiliate links

10. Integrations

- AI styling / recommendation engine
- image generation or fashion visualization service
- product catalog / retailer APIs
- affiliate link systems
- analytics platform
- authentication provider
- storage for uploaded closet images

11. Success Metrics

- number of looks generated per user
- saved looks per user
- click-through to shop links
- conversion to purchase or partner click
- repeat user sessions
- time spent on discover and styling screens
- closet uploads and saved favorites

12. MVP Scope

In Scope for MVP

- premium onboarding
- home / discover page
- AI style generator
- celebrity inspiration section
- trend discovery section
- look cards and detail view
- curated shopping section
- saved looks
- basic user profile

Out of Scope for MVP

- advanced social features
- full AR try-on
- live stylist chat
- multi-language support
- advanced admin analytics

13. Future Features

- AI virtual try-on
- body analysis / fit intelligence
- social sharing of looks
- collaborative style boards
- subscription-based premium stylist plan
- personalized push notifications for drops and trends
- wardrobe planning calendar
- event-based look planner

14. Technical Notes

- Recommended architecture: Next.js / React frontend with modular components and API routes.
- Static media should be stored under public or CDN-backed storage.
- Environment variables should be used for all secrets and API keys.
- Product and celebrity image paths must be structured consistently.

15. Open Questions

- Will checkout happen inside the app or via affiliate/retailer redirect?
- Will Maison Simon support both luxury-only and mixed-price-tier catalogs?
- What retailer and affiliate networks are priority integrations?
- Will the app include a free tier and paid subscription tier?
- How much user closet functionality is required for launch?

16. Summary

Maison Simon should launch as a premium AI styling and shopping experience that combines luxury branding, modern fashion discovery, celebrity inspiration, trend intelligence, and personalized recommendations into a single elegant app. The product should feel exclusive, highly curated, and intelligent, while remaining easy to use and visually aspirational.
